COVER IMAGE

Cover photograph: *Salmonella enterica* subsp. *enterica* serotype Newport filamentous cells formed after 16 h of exposure to 20 mM pelargonic acid. The filaments can exceed 100 μm in length and consist of multiple *Salmonella* cells that remain attached to each other due to a delay in the formation of septa. Filamentous morphotypes are short lived and disintegrate into individual cells when septum formation progresses to completion. (See related article at e02191-18.)
