COVER IMAGE

Cover photograph: Fluorescence microscopy image of the anaerobic dichloromethane degrader “*Candidatus* Dichloromethanomonas elyunquensis” strain RM in a microbial consortium. Strain RM was visualized by fluorescence *in situ* hybridization using a specific probe (purple color), while other microbial community members of the consortium were visualized with an unspecific fluorescent dye (blue color). Microbial dichloromethane degradation in the environment is destroying an ozone-depleting substance and has implications for bioremediation of sites impacted with polychlorinated methanes.
