COVER IMAGE

*Cover photograph:* Two enteric viruses, Tulane virus and rotavirus, were exposed to a common food sanitizer called peracetic acid (PAA) at pH values relevant for vegetable sanitation. Tulane virus showed a significantly higher resistance to PAA, while rotavirus became easily inactivated. The higher resistance of Tulane virus can be explained, in part, by significantly more aggregation of Tulane virus in PAA solutions. The image represents rotaviruses being dispersed and disinfected by PAA at pH 3. (Art by Miyu Fuzawa.) (See related article at e01095-20.) (Copyright © 2020 American Society for Microbiology.
