COVER IMAGE

Cover photograph: The environmental opportunistic pathogen *Chromobacterium violaceum* deals with fluctuations in the iron levels using the ferric uptake regulator Fur. In addition to iron, Fur regulates several traits, such as biofilm formation. The image shows the biofilm morphology of *C. violaceum* grown on peptone-sucrose agar (PSA) plates supplemented with iron. During biofilm development, the formation of complex macroscopic wrinkled structures occurs. This three-day-old *C. violaceum* colony shows violet color due to the production of the pigment violacein, a secondary metabolite with antimicrobial activity. (See related article at e01620-20.)
